In-Built Functions in MySQL

Agenda

1. What are In-Built functions
2. Number Functions
3. String functions
4. Date Fuctions
5. Aggregate Functions
6. Summary

1. What are In-Built functions

OBJECT™ TECHNOLOGIES

- **Single Row functions (Scalar functions)**
  - Single row functions are the one who work on single row and return one output per row.

- **Multiple Row functions (Aggregate functions)**
  - Multiple row functions work upon group of rows and return one result for the complete set of rows.
    They are also known as Group Functions or Aggregate Functions

2. Number Functions

- Number functions are **single row(scalar) numeric functions**.

- These functions are used for mathematical operations.

- Following are most commonly used number functions
  - round(n)
  - truncate()
  - ceil(m)
  - floor()
  - abs (n)
  - power(m,n)
  - Sqrt(m)
  - mod(m,n)

3. String functions

- Single row functions (scalar).
- These functions help in handling character data in the tables.
- Following are most commonly used string functions.
  - length()
  - lower()
  - upper()
  - ASCII()
  - Concat()
  - Concat_ws()
  - format()
  - reverse()
  - lpad()
  - rpad()
  - ltrim()
  - rtrim()
  - trim()
  - replace()
  - substr()
  - Substring()

4. Date Functions

- Date functions are single row functions (scalar).
- These functions are used to handle date type data.
- Following are commonly used data functions
  - curdate()
  - current_date()
  - now()
  - sysdate()
  - date_format(date, format)
  - datediff(date1,date2)
  - curtime()
  - date()
  - extract()
  - hour()
  - year()
  - day()
  - date_add(date,INTERVAL value addunit)
  - current_timestamp()
  - dayofweek()
  - last_day('2024-01-12')

5. Aggregate Functions

OBJECT™ TECHNOLOGIES

- Aggregate functions are used to perform any action on group of rows.

- Following are the aggregate functions given by MySQL…

  Sum()

  avg()

  min()

  max()

  count()

- Conditions on aggregate functions
  - Having clause

6. Summary

1. What are In-Built functions
