Dynamic Stack Data Structure

Objective Of Todays Session….

1. What is Stack.
2. Implementation Of dynamic Stack.
3. Node class
4. Linklist class .
5. Creation of linked list

Stack

A stack is an Abstract Data Type (ADT), commonly used in most programming languages. It is named stack as it behaves like a real-world stack, for example – a deck of cards or stack of plates, etc.

Stack has only end ,this feature makes it LIFO data structure. LIFO stands for Last-in-first-out. Here, the element which is placed (inserted or added) last, is accessed first. In stack terminology, insertion operation is called PUSH operation and removal operation is called POP operation.

Dynamic Stack

A Dynamic Stack is a stack data structure whose capacity (maximum elements that can be stored) increases or decreases in runtime, based on the operations (push or pop) performed on it.
In C, a dynamic stack is implemented using a Linked List, as **linked lists are dynamic data structures**.

Implementation of Stack
