OBJECT™ TECHNOLOGIES

Views

Agenda

1. Concept
2. Need of views
3. Handling views
4. Types of views
5. Summery

www.object.co.in

1. Concept

- View is a
  - -virtual table
  - -holds table structure but not the data

www.object.co.in

2. Need of views

- Implementing security
- Reducing query complexity
- Displaying selected data

3. Handling views

OBJECT™ TECHNOLOGIES

1. **Create view**

```
sql>create view v1 table_name
      as
       (
          select * from table  ;
       );
```

2. **Insert in view**

```
sql>insert into view_name
      values(column_list);
```

3. **Display view**

```
sql>select * from view_name;
```

4. **Delete view**

```
sql>drop vire view_name;
```

5. **Delete a row from view**

```
sql>delete
       from view_name
       where  condition;
```

6. **Update in view**

```
sql>update view_name
      set column_name = new value ;
```

7. **Alter view**

```
sql>alter view view_name
       add column_name data_type;

sql>alter view view_name
       drop column column_name;
```

4. Types of views

OBJECT™ TECHNOLOGIES

- **Creating Read-Only View**

```
create view view_name
as
  select  *
  from table_name
  [where condition]
  with read only;
```

- This view will restrict all DML (insert,delete,update) operations.

- **Creating Materialized View**

```
create materialized view view_name
as
    select  *
    from emp
    [where condition];
```
