

# Operations on Link List

1. Add node in beginning .
2. Add node at end of the linklist.
3. Add node in between.
4. Delete first node.
5. Delete last Node

```
class Node
{
    private int data;
    private Node next;
    public Node()
    {
        data=0;
        next=null;
    }
    public Node(int data)
    {
        this.data=data;
        this.next =null;
    }
    ..... Set and get methods..
}
```

```
class linklist
{
    private Node head;
    public head()
    {
        head=null;
    }
    public void createLinklist(int numberOfTerms)
    {
        .....
    }
    public void display()
    {
        .....
    }
}
```

# Add node in Beginng of Link List

```
public void addBeg(int data)
{
    Node newnode=new newnode(data);
    newnode.setNext(head);
    head=newnode;
}
```

# Add node in between.

```
public void addMid(int data,int pos)
{
    Node move,newnode=new Node(data);
    if(pos==1)
        addBeg(data);
    else
    {
        move=head;
        for(i=1;ipos-1;i++)
            move=move.getNext();
        newnode.setNext(move.getnext());
        move.setNext(newnode);
    }
}
```

# Add node at end

```
public void addEnd(int data)
{
    Node move, newnode = new Node(data);
    if(head == null)
        head = newnode;
    else
    {
        move = head;
        while(move.getNext() != null)
            move = move.getNext();
        move.setNext(newnode);
    }
}
```

# Delete first Node

```
public void deleteBeg ( ) {  
    if (head == null ) {  
        System.out.println(" Linked List is Empty );  
        return ; }  
    Node del=head;  
    head= head.getNext();  
    del= null;  
}
```
