

Bootstrap Forms

1. Introduction to bootstrap forms
2. Vertical and horizontal forms
3. Form element styling

- Bootstrap 5 Layout forms provide control of the input field and custom positioning.
- By default the form is aligned vertically
- Bootstrap grid to change this default placement
- Points to remember.
 - No specific class for form layout
 - All form elements must be in form element
 - Button in the form is by default of submit type
- Steps
 - Outermost element should be form
 - Wrap label and form control in one div.
 - Use "form-label" class for labels.
 - input tag must be using class="form-control"

- By default form elements will be stacked on top of one another vertically
- To arrange form elements horizontally side by side, bootstrap grid can be used
- Forms even can be designed to be responsive, we can consider some target screen where the form elements will be displayed inline but on smaller screens, it will be automatically stacked on top of one another.

- select menu:
 - To style a select menu in Bootstrap 5, add the .form-select class to the <select> element
 - Size of select can be even altered
- Checkboxes and radio buttons
 - use a wrapper element with class="form-check".
 - add the .form-check-label class to label elements, and .form-check-input to style checkboxes
 - input type as radio for creating radio buttons with same bootstrap classes
- textarea:
 - To style textare, we can add the .form-control class like text fields

- Input Groups
 - Container with `.input-group` class adds some icon, text or button in front or behind the text fields
 - `.input-group-text` can be used for styling this addition to input fields.
- Adding help text to form controls
 - block level help text can be added for a form control using the class `.form-text`.
