

Html Forms

1. Introduction to HTML forms
2. Different form elements
3. Advantages of HTML 5
4. New form elements and attributes

- Basics of HTML form
 - HTML Forms are required when there is need to collect some data from the site visitor.
 - The HTML <form> tag is used to create an HTML form.
 - <form> element is used as a container element for creating form.
 - One form element can have multiple form controls created by using input elements which may be associated with the labels

```
<form action="action_page.php">  
  First name:<br>  
  <input type="text" name="firstname" value="Mickey"><br>  
  Last name:<br>  
  <input type="text" name="lastname" value="Mouse"><br><br>  
  <input type="submit" value="Submit">  
</form>
```

- Important form attributes are
 - action: URL of the destination page which will process the submitted data. Default value is the same page.
 - method: Decides the way form data should be submitted. Default value is get
 - enctype: Decides how browser encodes the data before sending it to server

- Use of get and post.
 - Before the browser sends the information, it encodes the data.
 - Encoded data clubbed as name-value pairs as `name=value&name1=value1&name2=value2`
 - Get method
 - Sends the form's data on URL
 - It is not very secure way so should not be used for sending sensitive information
 - It has size restriction
 - Post method
 - Sends data in the request body
 - It is secure than get
 - No size restriction

- `<input>` element is most important element.
- It can be displayed in several ways, depending on the type attribute.
- For all input types name attribute is very important.
- Different input elements are:
 - text
 - password
 - checkbox
 - radio
 - hidden
 - submit
 - reset
 - hidden
- Important attributes are:
type, name, value, size, maxlength, checked

- There are few controls which can be created using different form elements than input.
- Examples of such elements:
 - select: used for creating drop down list for displaying options.
 - textarea: used for creating multi-liner text input

- HTML5 introduces a number of new elements and attributes that helps in building a modern website.
- **New semantic elements:** A semantic element clearly describes its meaning to both the browser and the developer.
- **Canvas:** This supports a two-dimensional drawing surface that you can program with JavaScript.
- **Audio & Video:** You can embed audio or video on your web pages without resorting to third-party plugins.
- **Geolocation:** Now visitors can choose to share their physical location with your web application.
- **New input types and attributes:** Will help in data validation

- HTML5 added several new input types:
- date, time, email, number, color, range, month etc
- New input attributes
 - required: Make the field compulsory
 - placeholder: Hint for the input
 - autofocus: Gains focus when form is loaded
- Input restrictions
 - min, max and step: Can be used to specify minimum and maximum value and can be used with number, date, time, range etc
 - pattern: Used for restricting the format of the data
