

Using JSON

1. Generating JSON on server
2. AJAX using jQuery

1. Generating JSON on server

- JSON mainly can be generated on server side by using various languages like java, express JS etc
- Server side generally receives data from client, accesses the database as per the requirement.
- Data expected by the client can be sent as JSON using some methods
- In express JS, json method can be called on response object which converts javascript object into JSON and sends to the client as in the form of response.

- Regular AJAX code is difficult to write because different browsers use different syntaxes for AJAX implementation.
- jQuery includes many functions
- load method
 - This method helps to load the contents received from the web server in a selected element of the webpage.
 - Basic syntax is `$(selector).load (URL, data, callback)`
- get method
 - The jQuery `get()` method is used to request data from a server via an HTTP Get request.
 - The syntax for jQuery Get is: `$.get(URL, callback)`

- post method
 - This method helps to request data from the server using the HTTP Post request.
 - The syntax for jQuery post() is `$.post(URL, data, callback)`
- ajax method
 - `$.ajax()` method is a powerful and straightforward way of creating Ajax requests.
 - It takes a configuration object as a argument that contains all the instructions and data that jQuery requires to complete the request.
 - The basic syntax is `$.ajax({settings})`
